# Assignment 8: Time Series Analysis

Yifei Zhang

### **OVERVIEW**

This exercise accompanies the lessons in Environmental Data Analytics (ENV872L) on time series analysis.

## Directions

- 1. Change "Student Name" on line 3 (above) with your name.
- 2. Use the lesson as a guide. It contains code that can be modified to complete the assignment.
- 3. Work through the steps, **creating code and output** that fulfill each instruction.
- 4. Be sure to **answer the questions** in this assignment document. Space for your answers is provided in this document and is indicated by the ">" character. If you need a second paragraph be sure to start the first line with ">". You should notice that the answer is highlighted in green by RStudio.
- 5. When you have completed the assignment, **Knit** the text and code into a single PDF file. You will need to have the correct software installed to do this (see Software Installation Guide) Press the **Knit** button in the RStudio scripting panel. This will save the PDF output in your Assignments folder.
- 6. After Knitting, please submit the completed exercise (PDF file) to the dropbox in Sakai. Please add your last name into the file name (e.g., "Salk\_A08\_TimeSeries.pdf") prior to submission.

The completed exercise is due on Tuesday, 19 March, 2019 before class begins.

# Brainstorm a project topic

1. Spend 15 minutes brainstorming ideas for a project topic, and look for a dataset if you are choosing your own rather than using a class dataset. Remember your topic choices are due by the end of March, and you should post your choice ASAP to the forum on Sakai.

Question: Did you do this?

ANSWER: Yes.

### Set up your session

2. Set up your session. Upload the EPA air quality raw dataset for PM2.5 in 2018, and the processed NTL-LTER dataset for nutrients in Peter and Paul lakes. Build a ggplot theme and set it as your default theme. Make sure date variables are set to a date format.

# Run a hierarchical (mixed-effects) model

Research question: Do PM2.5 concentrations have a significant trend in 2018?

- 3. Run a repeated measures ANOVA, with PM2.5 concentrations as the response, Date as a fixed effect, and Site.Name as a random effect. This will allow us to extrapolate PM2.5 concentrations across North Carolina.
- 3a. Illustrate PM2.5 concentrations by date. Do not split aesthetics by site.

```
ggplot(EPAair, aes(x = Date, y = Daily.Mean.PM2.5.Concentration))+
  geom_point()+
  labs(x="")+
  ylab(expression(paste("PM2.5 Concentration(\U0003BCg/m"^3,")")))
```

3b. Insert the following line of code into your R chunk. This will eliminate duplicate measurements on single dates for each site. PM2.5 = PM2.5[order(PM2.5[,'Date'],-PM2.5[,'Site.ID']),] PM2.5 = PM2.5[!duplicated(PM2.5\$Date),]

3c. Determine the temporal autocorrelation in your model.

3d. Run a mixed effects model.

```
EPAair = EPAair[order(EPAair[,'Date'],-EPAair[,'Site.ID']),]
EPAair = EPAair[!duplicated(EPAair$Date),]
PM2.5Test_auto <- lme(data = EPAair,
                      Daily.Mean.PM2.5.Concentration ~ Date,
                     random = ~1|Site.Name)

Is there a significant increasing or decreasing trend in PM2.5 concentrations in 2018?
     ANSWER: The p-value is 0.36 > 0.05, which indicates there is not a significant trend in PM2.5
     concentration in 2018.
3e. Run a fixed effects model with Date as the only explanatory variable. Then test whether the mixed effects
model is a better fit than the fixed effect model.

Which model is better?</pre>
```

ANSWER: The mixed effect model is better due to the lower AIC

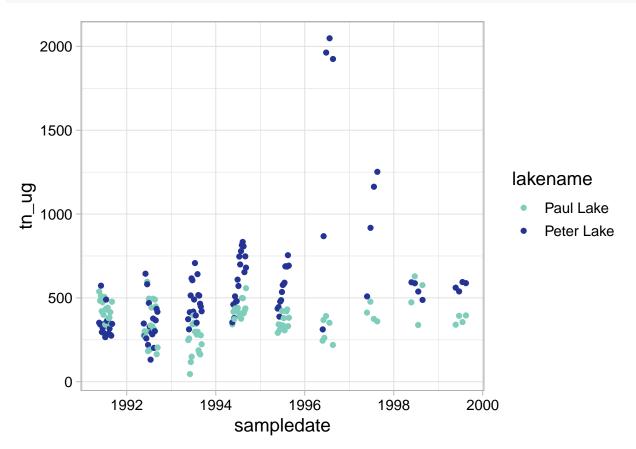

#### Run a Mann-Kendall test

Research question: Is there a trend in total N surface concentrations in Peter and Paul lakes?

4. Duplicate the Mann-Kendall test we ran for total P in class, this time with total N for both lakes. Make sure to run a test for changepoints in the datasets (and run a second one if a second change point is likely).

```
PeterPaul.surface <-
PeterPaul %>%
select(-lakeid, -depth_id, -comments) %>%
filter(depth == 0) %>%
filter(!is.na(tn_ug))

# Initial visualization of data
ggplot(PeterPaul.surface, aes(x = sampledate, y = tn_ug, color = lakename)) +
geom_point() +
scale_color_manual(values = c("#7fcdbb", "#253494"))
```

```
# Split dataset by lake
Peter.surface <- filter(PeterPaul.surface, lakename == "Peter Lake")
Paul.surface <- filter(PeterPaul.surface, lakename == "Paul Lake")
mk.test(Peter.surface$tn_ug)
##

     15.0000000 8514.3333333
##
                                0.0174216
What are the results of this test?
```

ANSWER: There is not a trend over time in total N surface concentration in Paul lake. (Mann-Kendall test, p-value = 0.7) For Peter lake, there is a trend over time in total N surface concentrations, and the two change points are at 1993-06-05 and 1994-06-30. (pettitt test, p-value <0.0001)

5. Generate a graph that illustrates the TN concentrations over time, coloring by lake and adding vertical line(s) representing changepoint(s).

```
ggplot(PeterPaul.surface, aes(x = sampledate, y = tn_ug, color = lakename)) +
  geom_point() +
  geom_vline(xintercept = as.Date("1993-06-02"),color="yellow", lty = 2)+
  geom_vline(xintercept = as.Date("1994-06-29"),color="yellow", lty = 2)+
  scale_color_manual(values = c("#7fcdbb", "#253494"))+
  labs(x = "", y = "total N(\U003BCg/L)")
```
